One of the foremost concerns for reputable commercial construction companies is the significant amount of time required for contractors and cost estimators to commit to pricing up raw materials like steel and concrete. This is due to the constantly changing massive inflation rates, which result in a need for continuous researching and reporting on pricing information. In addition these companies need to ensure they have good relationships with their major subcontractors and suppliers, in order to capitalize on their capacity to forecast and budget the costs effectively throughout the whole construction process. However, some construction owners are taking a more proactive role throughout the whole process to streamline communications and impel project completion, by functioning as a team member.

Question 1

Constantly changing inflation rates causes considerable problems for cost estimators.

A UN report has warned of the potential problems of global warming. If the production of greenhouse gases continues at the current rate, this will result in the melting of ice sheets in Greenland and the Antarctic. The consequences of this will be rising sea levels, which will endanger 145 million people. In response to the problem, the report observes the need for an immediate international agreement on reducing emissions.

Question 3

Emission of greenhouse gases can result in a change in sea levels.

A few 'Safe As Houses' alarms have been redesigned in an attempt to reduce the large number of complaints where alarms have sounded by accident. One of the new types of alarm is less sensitive than its predecessors. Studies have shown that these newer alarms are rarely activated for no apparent reason. 'Safe as Houses' still sells a number of the original, sensitive alarm systems, because the increase in threshold for motion detection means that the new style alarms may fail to register break-in where limited force is being used.

Question 5

All of the company's alarm systems are now less sensitive.

Despite vehicle improvements and campaigns for road safety, many injuries and fatalities are still caused by collisions and other incidents involving vehicles. According to investigations in the United States, some of these accidents could be prevented through the development of a mobile internet network. All of the cars on a stretch of road would be linked to each other, comprising the mobile network. Only one of these vehicles would need to be connected to the internet to download travel news to the mobile network. The studies highlight the safety advantages of such a system, which would enable drivers to find out about accidents and potential dangers as they happen and in relation to their particular location. Drivers and emergency service teams would have detailed information about problematic areas. There are, however, possible drawbacks to the development of such networks, not least that the availability of data within them could facilitate privacy infringements.

Economic research has identified a trend exhibited by one in six Britons of hiding cash in their homes instead of investing it. This is termed the 'Biscuit Tin Economy'. It is estimated that £3.5 billion is currently hidden, sometimes in obscure places, such as under mattresses or in fridges, in homes across the country. Reasons for this are varied, for example 6% are concealing it from their partners, and 4% believe their money to be safer at home than in a bank. Researchers maintain that these actions demonstrate economic folly, and that, as a result, Britons are sacrificing up to £174 million in interest every year. This 'Biscuit Tin Economy' is betraying those who trust in it, as it renders their hidden money both unproductive and potentially unsafe, whereas it could be profitably invested in a stocks or high-interest savings plan, for example.

Question 23

A consequence of hiding money rather than investing it is a nationwide loss of many millions in interest each year.

- ☐ True
- ☐ False

The diverse topography of the Peak District is chiefly due to stretching of the earth's crust, and thinning of Chert and Limestone as a result of plate tectonics. Chert is a variety of quartz created where diatoms and microscopic creatures have died and been condensed as a form of liquid silica. The chalk equivalent is flint, which has different properties, and was used during the stone ages for making tools. Limestone is primarily a calcium carbonate and can be created from the integration of shell, algae or plankton deposits within sediment. Although it would appear that the current topography came about from re-exposed earlier features, there is not much that can be uncovered about the geology of the Peak District after the Carboniferous period. It is possible that there were Permo-Triassic deposits as outcrops of this age have been discovered close to the boundaries of the area.
